

# Foto Gong

Classic or wireless – the perfect door annunciator system for keeping an eye on the front door around the clock

# Welcome your costumers and give you good security

For more than 40 years Servodan has sold the Foto Gong - the most proven and durable door announcing system on the market. Foto Gong is available in 3 variants, namely IR, PIR and wireless PIR, all 3 have been improved in a number of areas - like even better sound quality, more easy installation, etc.

Below you can see more about the 3 Foto Gong packages and what the difference between them really is.

In short, the Foto Gong IR (infrared) is suitable for smaller shops. Foto Gong PIR (passive infrared) is perfect for larger stores where people don't move around in the entrance area. And the wireless Foto Gong PIR is inherently perfect in stores, where the wiring between PIR sensor and central is not possible or very difficult.

Whichever of the 3 solutions that best suit your store, you are sure to get a proven and durable solution that gives you great security in the daily business and offers customers welcome.

## Plenty of advantages:

- Welcomes your costumers with 4 optional and pleasant sounds
- Improves safety, security and customer service – an open door attracts people
- Sends a signal even when door is open
- Improves indoor climate - you can keep the door open i.e. on a hot day
- Very easy to install and to operate

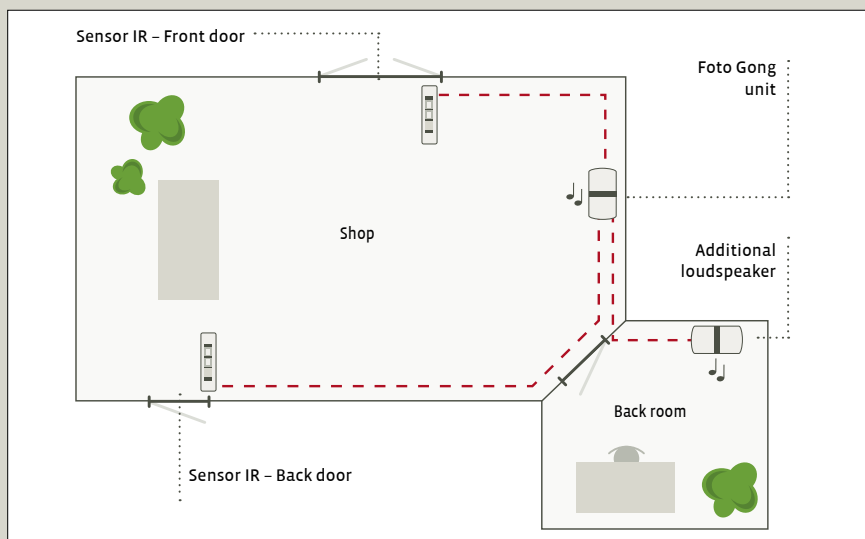

## Foto Gong IR

A very reliable solution where an IR sensor is fitted by the door with a reflector above. The selected tone will sound if the beam is broken.

The solution is particularly well-suited to entrance doors for smaller shops where customers often move about in and around the doorway. Foto Gong IR is not affected by external conditions such as temperature and draughts that can occur in certain environments.

The system can be expanded using additional sensors, switches and an extra loudspeaker, which can, for instance, be placed in an adjacent room.

Foto Gong  
welcome your  
customers with  
a pleasant sound

## Foto Gong PIR

An ideal solution where a PIR sensor is fitted above the door and detects motion within a field in front of the door. The detection area in front of the door can easily be limited via an ingenious setting on the PIR sensor itself, thereby avoiding undesired detection.

This solution is particularly well-suited to entrances where people are not immediately in front of the door, and where installing the sensor above the entrance is most appropriate. The system can also be extended by using additional sensors, switches and an extra loudspeaker.

# Foto Gong PIR wireless

The wireless Foto Gong PIR is a perfect solution where a PIR sensor is fitted above the door and detects motion within a field in front of the door. The system has major advantages in cases where wiring between the sensor and unit is either impossible or very difficult. The detection area in front of the door can easily be limited via an ingenious setting on the PIR sensor itself, thereby avoiding undesired detection. The sensor is connected to the 230V adapter supplied, or it can be fitted with batteries if mains connection is not possible. This makes installation very simple.
